

## Verification of the the JJA 2024 SEECOF outlook over The Republika Srpska, Bosnia and Herzegovina

### 1. SEECOF-31 Consensus Statement of the Climate Outlook for summer 2024.

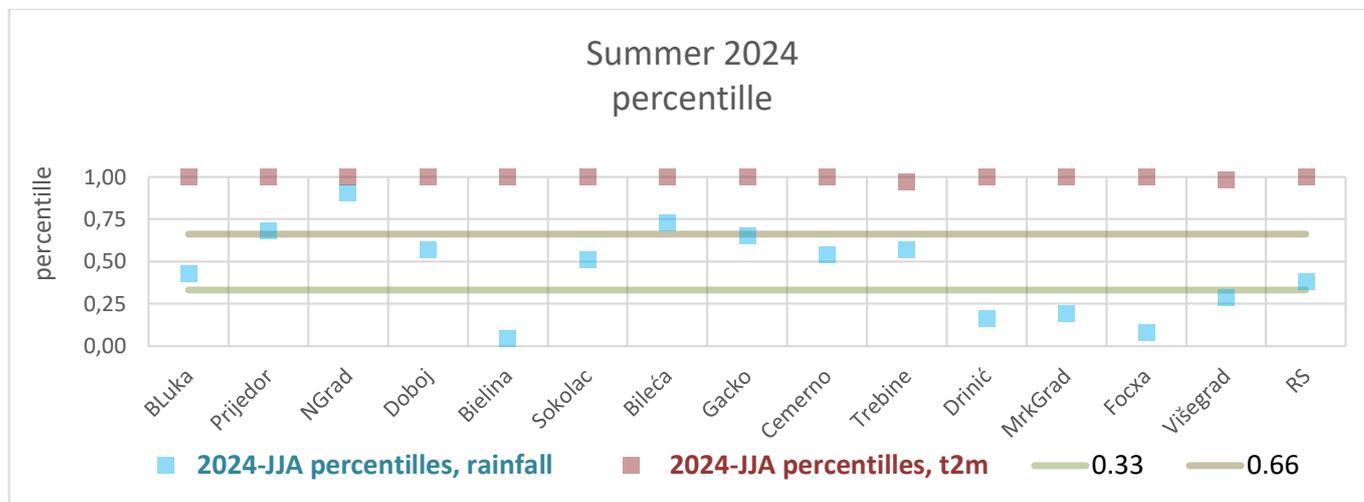

#### Temperature and Precipitation

According to the seasonal outlook, based on tercile ranks and climate classification ratings, thermal conditions over the Republika Srpska for 2024 summer had been described as warmer than normal (the portion 1, down left). According to observed values, this climatological prognosys was excellent over entire Republic of Srpska. Precipitation forecast was with „no signal“ and below normal southern (the portion 2 and 1, down right). Analyse based on observations across the territory shows normal weather pattern over the most area, and drier in the eastern and south west; due to a convective unstability, locally was wetter in the north-western and souhern places. The precipitation outlook was correct, giving chances for usual climate weather pattern and ocured rainfall trends, also for huge convective rainfall, locally.

Temp (left) and PRC tot (right) for Summer 2024 outlook (below) and observed values (above)

- According Tmean percentille categories of air temperature, most summer days were extremelly above normal values.
- Hottest July and August since 1950 with Tmean monthly deviation from 2.67 °C (South) to 4.86 °C (North).
- Record high rainfall in August in the northwest (Novi Grad, Prijedor).

Record high rainfall in August in the northwest (Novi Grad, Prijedor).

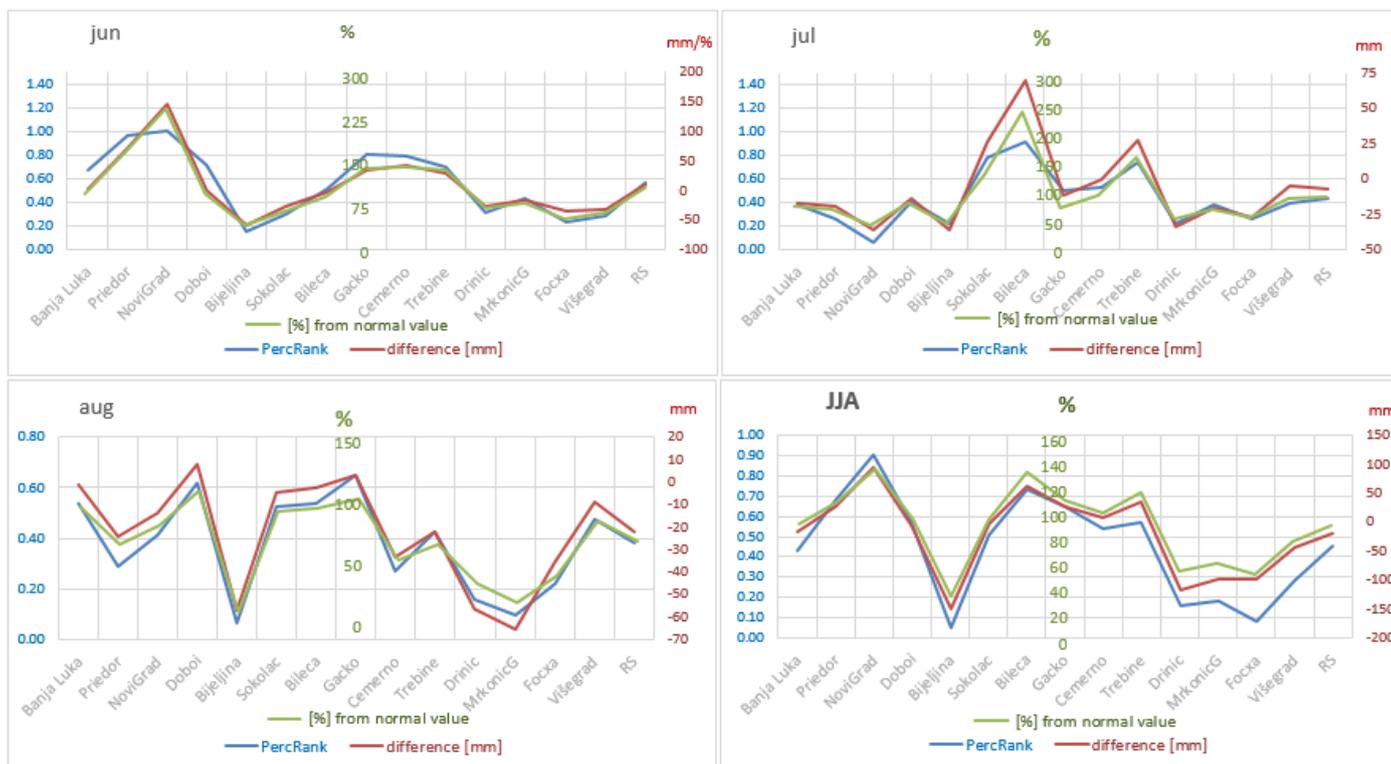

Spatial presentation of the JJA-2024 rainfall percentiles over the Republic of Srpska station network

Total JJA rainfall from 141mm in the southeast to 233mm in the northwest. The average deficit for the area of Srpska is about 10% (depending on the reference period of the analysis). Monthly deviation ranges from -83 mm (northeast) to +21 mm (South). Years with the least amount of rainfall: 2012; 1952; 1950; 2017; 2000; 2003 ... years with the highest summer rainfall 1969; 2014; 1959; 1976; 1972...

Statistical indicators of weather conditions when it comes to rainfall amounts (percentiles, deviation and percentage of achievement from normal) are shown in the chart below, for representative meteorological stations in the Republic of Srpska.

## 2. High impact events:

High impact events: long lasting heat waves and extremely high summer temperatures, caused water shortage, drought at eastern places; most of wild fires occurred at the Southern area (Eastern Herzegovina). A record high rainfall in August in the northwest caused torrential flooding.

### 3.Verification of the climate outlook for the 2024 summer

Country	Seasonal temperature (JJA)		Seasonal precipitation (JJA)	
	Observed	SEECOF, MedCOF <i>climate outlook</i>	Observed	SEECOF, MedCOF <i>climate outlook</i>
The Republika Srpska, Bosnia and Herzegovina	<b><i>Above normal</i></b>	<b><i>Above normal</i></b>	<b>Normal, below; locally above</b>	<b><i>No signal or drier</i></b>

#### Assesment:

Extremelly hot weather observed in Republic of Srpska, normal-drier conditions. Locally, in the southern (Bileća, Novi Grad) record breaking rainfall amount, due to convective unstability.

**The outlook was correct for both climate prognosys, temperature and precipitation (according actual climate trends).**
